Choosing a commercial implementation of RSA algorithm is a good choice it is very secure and well known algorithm. It is not easy to crack it and decrypt the data by the third party. But we can't say whether it would be the best choice or not because it may be quite time consuming and if the information is not that much critical as mentioned in the question than we can even use DES algorithm for the encryption and decryption purpose.

The RSA algorithm would be good if we want to encrypt the transaction management system data in the insurance website.
