- Ans. steps that I would like to recommend to Jaun IS given below:
- 1) Juan can use internal application scanners to validate the code of developer. it helps Juan to increase security.
  - 2) updating Operating System and Kernel to get the latest security features and to have all new updates in order to protect the web server.
  - 3) back and recovery must be taken into consideration as Juan is a network administrator. so, it is her responsibility to maintain the proper backup and restoring facility in case of any disaster or network problem.
  - 4) maintaining logfile records of the user who are working in the company environment.so, that tracking the suspicious activity is easy to monitor and track.
  - 5) restricting the access of the user from the security point of view, provide access to confidential data to the authorized users only.
  - 6) must keep track of all the server activities.
  - 7) use of private network servers and VPN(virtual private network) to enhance the security and restricting access to limited user.
